

## **Circuit Description**

### **Model No.: Aster/PT-V4RX**

After receiver receiving the control signals sent by Aster/PT-V4RX transmitter, it will decode and process the signals, then it will trigger the camera's top flash synchronously. Besides, receiver has the flash detection function, when the photosensitive detection head has detected flash outside, it will send signals to control chip, after chip's dealing with signals, the flash will flash synchronously.

Circuit's features:

- 1) Radio frequency
- 2) Low-frequency trigger
- 3) Harmless to Cameras
- 4) Channel Isolation
- 5) Independent channel engineering without interference.
